# 2021 NEWBORN HEARING SCREENING IN MAINE

A DATA BRIEF BY THE MAINE NEWBORN HEARING PROGRAM FOR HEALTHCARE PROVIDERS AND BIRTHING CENTERS

The Maine Newborn Hearing Program (MNHP) at the Maine CDC promotes and supports hearing screening for all Maine newborns and refers those in need for further testing and/or intervention services.

Early identification of hearing loss and early intervention can minimize the impact hearing loss has on a child and family. According to the American Academy of Pediatrics' *Early Hearing Detection and Intervention (EHDI)* **1-3-6** *Guidelines*, all children should receive:

### MAINE HEARING SCREENING DATA

**KEY BENCHMARK #1:** 95% (n=11,061) of babies born in Maine were screened within 1 month of age.

#### **Screening Prevalence**

Of **11,683 births** that occurred in Maine in 2021:

- 96% (n=11,265) received a newborn hearing screening
- 4% (n=418) had no documented screening

The most common reason for a lack of documented screening was due to the infant being delivered at home.

Figure 1: Reasons for lack of infant hearing screening documentation (n=418)

#### **Screening Results**

Of 11,265 infants screened:

- 97% (n=10,955) passed
- 3% (n=310) did not pass and were referred for additional testing

#### **Screening Home Births**

Births that occur at a hospital are more likely to be screened than births that occur at home.

• 99% of hospital births were screened compared to 28% of home births.

**1** in **4 home births** received a hearing screen in 2021.

**KEY BENCHMARK #2:** 60% (n=208) of infants had a complete diagnosis within 3 months of age.

### **Diagnosis Prevalence**

Of 345 newborns with a screening who were referred for further testing (n=310) or without a screening who went straight to diagnostic testing (n=35):

- 82% (n=283) had an audiological report with a complete diagnosis sent to MNHP.
- **18%** (n=62) **did not have diagnostic data reported to MNHP**, most commonly due to unresponsive parents/family.

**Figure 2:** Reasons for lack of documented diagnosis (n=62) \*Other includes missing a diagnosis due to appointment(s) affected by COVID-19 pandemic

### **Diagnosis Results**

Of 283 newborns with a complete reported diagnosis:

- 90% (n=256) diagnosed with typical hearing
- 10% (n=27) diagnosed with permanent hearing loss, most commonly sensorineural.

### Lost to Follow-Up

**12%** (n=41) of Maine infants referred for further testing were **lost to follow-up (LFU).**\*\*

\*\*LFU is defined as instances where family was contacted but unresponsive, unable to contact, or unknown reason for no documented diagnosis.

## MAINE EARLY INTERVENTION DATA

**KEY BENCHMARK #3:** 67% (n=18) of infants with hearing loss were enrolled in early intervention within 6 months of age.

Of the **27** infants who were diagnosed with hearing loss in 2021:

- 100% (n=27) were referred to an early intervention (Part C) provider
- 74% (n=20) had confirmed enrollment with an early intervention (Part C) provider sent to MNHP

## **ROOM TO IMPROVE**

The goal of MNHP is to ensure that every child receives care that meets the *EHDI* **1-3-6** *Guidelines*. Maine already screens almost all newborns for hearing loss, but there is room to improve rates of screening among home births, diagnoses within 3 months of birth, and enrollment of those with confirmed hearing loss in early intervention within 6 months of birth. MNHP continues to work with providers and families to ensure that infants with hearing loss are identified early and receive appropriate services.

Note: 2021 Maine Newborn Hearing Screening data were obtained via *Maine Smart CHSTS Newborn Screening Portal*, the Maine Newborn Hearing Program's data reporting platform. Data are submitted to the portal by screening facilities, audiologists, and early intervention providers to provide comprehensive surveillance on hearing loss and treatment in infants across the state.
