RE: Work Order: 0939019  
Client Contract No: 4574

Project: AXS018  
Purchase Order: 13691-A

Dear Ms. Whetung,

On September 24, 2009, Brooks Rand Labs (BRL) received twenty-five (25) homogenized fish tissue samples. Samples were logged-in for the contracted analyses of mercury (Hg), silver (Ag), aluminum (Al), cadmium (Cd), chromium (Cr), copper (Cu), iron (Fe), lead (Pb), nickel (Ni), selenium (Se), zinc (Zn), and total solids determination. All samples were received, prepared, analyzed, and stored according to BRL SOPs and EPA methodology.

BRL observed CRM recoveries for both Al and Pb analyses that did not meet the lower acceptance criteria limit (70 – 130%). CRMs DORM-3 (fish protein) was certified Al and Pb analysis, while CRM IAEA-407 (fish homogenate) was certified for Pb analysis and provided an information value for Al analysis. All samples were re-analyzed and the results confirmed the initial recoveries. Samples were then re-prepared and re-analyzed; CRM recoveries did not demonstrate an improvement in the extraction of either element.

A nitric acid digestion procedure was used to prepare all samples and has been the standard digestion method for all biota samples. Since the consistently low CRM recoveries were observed (October 2009), BRL has been performing various digestion techniques and will report all quality assurance data and sample results for the analysis of Al and Pb in a separate report addendum.

Sample results have been reported on a wet and dry-weight basis in both the hard copy report and electronic data deliverables. The reporting units of all batch quality control samples in which client samples were utilized have been reported on a dry-weight basis. All other quality control samples (i.e. CRMs, BLKs) have been reported on a wet-weight basis. This was due to a limitation of BRL's laboratory information management system.

In instances when the native sample result was below the sample-specific MDL the RPD was not calculated between the DUP result and the native sample result, as the RPD would not be considered a valid indication of duplicate precision.

### **Sequence 0900842, Batch B091376 – Total Hg**

The analysis of the first BLK produced a result that was omitted as a Grubb's outlier and the –BLK1 result was not included in the blank-correction calculations. Consequently, the sample results were blank corrected using the average of the three remaining BLK samples.

Due to unknown historical sample concentrations, all MS/MSD sets were spiked at concentrations greater than 5 times the native sample results. Recoveries have been reported to demonstrate duplicate precision only. All other quality control sample results met the acceptance criteria.

### **Sequence 0900876, Batch B091422 – Ag, Cd, Cr, Cu, Ni, Se, Zn**

Both reported CRMs (DORM-3 and IAEA-407) were certified for Ag analysis at levels less than the MRL (0.100 mg/kg) and were not reported.

The Cr and Ni analyses of CRM IAEA 407 Fish Homogenate produced recoveries below the acceptance criteria at 63% and 70%. However, the results and the respective certified values were less than five times the MRLs for both Cr and Ni, and the difference between the results were less than two times their respective MRLs. Therefore the secondary respective criterion was met and no qualification of the data was necessary.

The Zn analysis of the –DUP1, performed on sample *L 13452-3 / Winnicut- 10 Males* (0939019-03), produced an RPD exceeding the limit at 51%. The sample result was qualified **M** for duplicate imprecision. As two other DUP quality control samples produced acceptable RPDs no additional qualification of the results was required.

All MS/MSD sets analyzed for Ag and Cd were spiked at concentrations greater than five times the native sample results. The last two MS/MSD sets for Ni analysis and the –MS/MSD3 set for Cr and Cu analyses were spiked at concentrations too much greater than the native sample results. Conversely, -MS/MSD1 for Cr analysis were spiked at concentrations less than the native sample result. Recoveries have been reported to demonstrate duplicate precision only. All other quality control sample results met the acceptance criteria.

### **Sequence 0900885, Batch B091502 – Fe**

The analysis of –DUP1 and –DUP3 and the corresponding sample results [*L 13452-3 / Winnicut- 10 Males* (0939019-03) & *L 13452-21 / Deer Meadow BK- 20 Females* (0939019-21)] produced RPDs which exceeded the control limit at 45% and 117%. The native sample result and –DUP1 result were less than five times the MRL and the difference between the results was less two times the MRL; satisfying the secondary acceptance criteria. However, sample *L 13452-21 / Deer Meadow BK- 20 Females* (0939019-21) was qualified **M** for duplicate imprecision. No further qualification of the data was required on the basis of the one additional passing –DUP2 RPD.

All MS/MSD sets were spiked at concentration greater than five times the native sample results. The recoveries have been reported to demonstrate duplicate precision only.

The results were method blank corrected as described in the calculations section of the relevant BRL SOP(s) and may have been evaluated using reporting limits that have been adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details. All data was reported without further qualification and other all associated quality control sample results meet the acceptance criteria.

BRL, an accredited laboratory, certifies that the reported results of all analyses for which BRL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report. Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Tiffany Stilwater

## Report Information

### Laboratory Accreditation

BRL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BRL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <<http://www.brooksrand.com/default.asp?contentID=586>>. Results reported relate only to the samples listed in the report.

### Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

### Definition of Data Qualifiers

(Effective 9/23/09)

- B** Detected by the instrument, the result is  $>$  the MDL but  $\leq$  the MRL. Result is reported and considered an estimate.
- E** An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
- H** Holding time and/or preservation requirements not met. Result is estimated.
- J** Estimated value. A full explanation is presented in the narrative.
- J-M** Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.
- J-N** Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.
- M** Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.
- N** Spike recovery was not within acceptance criteria. Result is estimated.
- R** Rejected, unusable value. A full explanation is presented in the narrative.
- U** Result is  $\leq$  the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
- X** Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch.  
Result is estimated.

These qualifiers are based on those previously utilized by Brooks Rand, Ltd., those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses; USEPA; July 2002. These supersede all previous qualifiers ever employed by BRL.
