

## **BACKGROUND**

Each year, MDIFW biologists, contractors, and volunteers examine roughly 15-25% of all harvested deer. They look at things like sex, age, weight, yearling antler beam diameters, and antler points. From adult deer, they will often pull an incisor tooth, which will be aged under a microscope in a lab. These results are used to look at population age structure.

In 2023, the percentage of yearling males in the buck harvest was down compared to 2022 (35% in 2023 vs. 43% in 2022). We have seen significantly fewer yearling bucks in the harvest for the last couple of years, but this fluctuates in response to a variety of factors including changes in the way antlerless harvest is handled, messaging about buck age structure management, and fluctuations in fawn recruitment resulting in pulses at advanced age classes in later years.

MDIFW prefers all hunters be able to harvest whatever deer best fits their own hunting values and the experience they are looking for, but we recognize that some Maine hunters want to see more bucks of an older age class. We encourage all Maine deer hunters that are interested in managing for an older age class of buck to consider voluntarily passing on younger bucks and allowing them to grow for another year. While many hunters believe that passing a young buck just means that the next nearest hunter will take it, that should not be assumed. While this certainly happens some of the time, many of those young bucks that are allowed to pass by will live to see another year. In Maine- perhaps more than most states- there is a lot of room for a young buck hide and evade hunters until the next year. For more information on buck age structure management and implications, please visit:

<https://www.maine.gov/ifw/hunting-trapping/hunting/species/deer/managing-buck-age-structure.html>

At the end of this report, you will find summary age structure figures for 2023 harvested deer organized by MDIFW Region. A map of MDIFW Regions will be included as well for reference. To produce these figures, we try to sample at least 150 adult deer of each sex in each Region, though we do collect more samples from southern Maine where most of our deer live and most of our harvest occurs. This sample size is intended to be enough to represent out to five age classes: yearling, 2-year-old, 3-year-old, 4-year-old, and 5+ year-old; however, we are not able to collect enough teeth from some sex-age classes in some areas. This is particularly an issue in northern Maine where antlerless harvest is limited, which limits our ability to sample from female deer.

Thank you very much for providing our Department with the samples required to do these analyses.

**2023 DEER AGES**

Below are estimated ages for 2023 harvested deer. They are listed alphabetically by last name, then first name. If you did not specifically request that your deer be aged when the tooth was pulled, it may not be present in the sample; only a sub-sample of all teeth that are collected are sent to the lab for aging in addition to specific age requests. Furthermore, not all teeth sent to the lab are able to be aged. This may be the case if the incorrect tooth was pulled, the root of the tooth was broken or cracked, or the confidence level in the age was just low. A <blank> or "X" age means the lab received the tooth but was not able to age it, likely due to the tooth being broken or incomplete. A "0" age indicates a fawn.

<u>Last Name</u>	<u>First Name</u>	<u>Seal or ID</u>	<u>Town of Kill</u>	<u>Sex</u>	<u>Age</u>

**FIGURES**

MDIFW Regions.

Age structure by Region and sex. Sample sizes are indicated in the figure titles (n= #). Low samples (less than 100) result in relatively low confidence in the overall age structure.
